

EM2 - SEAT

The SEAT working group will tackle technical and methodological barriers to enabling secure data sharing and overcome privacy concerns in support of demand side energy programs and non-wires/pipes procurement projects. This working group will create initial methods guidance for approval by the Technical Steering Committee.

The SEAT Working Group meets the last Wednesday of the month. The meetings are a forum to discuss on-going progress on updates under consideration, testing, or ready for approval by the working group. GitHub is the primary tool for collaboration and documentation, and a Technical Chair facilitates the processes described in the working group charter.

Working Group Boundaries:

- Consistent methods for secure data transfer within pay for performance market applications
- Use cases to support market access to site level energy consumption data, without violating individual privacy rules, for
 - forecasting,
 - carbon accounting,
 - energy modeling,
 - comparison groups, etc,
