Project Details

Project Scope

The project encompasses the following activities:

- Specifying the requirements to be fulfilled by the reference platform
- Specifying the test procedures needed to assess the fulfillment of the requirements
- Building the appropriate system(s) architecture(s) for the software platform and specifying requirements for hardware architecture
- Developing code for the specific functions and services to be delivered by the platform
- Defining and implementing APIs to external applications
- Performing the integration of the software platform
- Testing the fulfillment of the requirements after the implementation, as a proof-of-concept, of a realistic protection and automation system on top of the integrated software platform
- Defining guidelines and best practices to integrate, test (including interoperability tests) deploy, and maintain the applications on such platform
